PHOENICS

An Overview

Overview

 This presentation is intended to be a general overview of PHOENICS, its applications, and how to use it.

PHOENICS Overview

- PHOENICS is a general-purpose CFD code
- The name PHOENICS is an acronym standing for:

P arabolic H yperbolic O r **E** Iliptic N umerical ntegration C ode S eries

PHOENICS Overview

- PHOENICS is based on the finite volume method.
- Domain is discretized into a finite set of control volumes or cells.
- General conservation (transport) equations for mass, momentum, energy, etc. – inflows and outflows in each cell must balance.
- Values of pressure, three velocity components, temperature etc in all the cells are computed by an iterative procedure.
- The distributions of these variables can then be displayed graphically.

Main Features of PHOENICS

- Cartesian, Polar and Body-Fitted Coordinates
- Cut-cell technique for complex geometry
- Conjugate Heat Transfer
- Single or Multi-Phase Flow
- Particle Tracking
- Chemical reaction
- Radiation
- Non-Newtonian Flow
- Choice of equation solvers and differencing schemes
- "InForm" user programmability
- Automatic convergence control

Main Features of PHOENICS

Lecture

PHOENICS predicts quantitatively:-

- how fluids (air, water, steam, oil, etc) flow in and around:
 - engines,
 - process equipment,
 - buildings,
 - lakes, river and oceans,
 - and so on;
- the associated changes of chemical and physical composition

PHOENICS Structure

PHOENICS consists of several modules:

- Pre-processor for setting up pro
- Solver
- Post-processor
- POLIS

for setting up problems, for solving the problem, for visualising results; and for providing information.

PHOENICS Structure

How the model is defined

Problem definition normally involves making statements about:

- **geometry**, ie shapes, sizes and positions of objects and intervening spaces;
- grid, ie the manner and fineness of the sub-division of space and time;
- processes, for example:- whether the heat transfer is to be calculated; whether materials are inert or reactive; whether turbulence is to be simulated and if so by what model

How the model is defined

- materials, i.e. thermodynamic, transport and other properties of the fluids and solids involved;
- environmental or boundary conditions; and
- **numerical parameters** (i.e. non-physical) affecting the speed, accuracy and economy of the simulation.

The "Virtual-Reality" Interface

Lecture

HAM

Model setup – VR Editor

- The model is defined as a set of "objects".
- Clicking on an object brings a dialogue box onto the screen.
- This enables the information about the object to be edited.

The Virtual-Reality Interface Import a CAD file

Lecture

•

Model setup – VR Editor

- The object geometry can be taken from a library of shapes, or loaded from a CAD file.
- CAD geometry formats include STL, DXF, 3DS and many others.

Setting Up Problems: PHOENICS-VR main menu

Lecture

The PHOENICS-VR Main menu allows you to make all the settings required for a problem, including:

- Geometry
- Variables to be solved (models)
- Fluid properties
- Initial values
- Boundary conditions
- Numerical controls
- Printout options

A Typical EARTH Convergence Monitor Plot

Lecture

- EARTH is the program that performs the simulation.
- The graphical monitor shows the converging solution.

Solver-Graphics Monitoring

Lecture

CHAM

The EARTH run can be interrupted to change several parameters:

- Monitoring position
- Relaxation factors
- Graphical monitor settings
- Intermediate result files can also be dumped

Analysis of Results - VR Viewer

Lecture

The VR Viewer allows users to see their results in a number of different ways:

Analysis of Results - VR Viewer

User Programmability

- In-Form enables users of PHOENICS to greatly extend its capabilities, without any need to write FORTRAN coding.
- Users are enabled to express their requirements by way of formulae.
- These are read by the Input Module (Satellite), which transmits them to the Solver Module (EARTH); this then interprets them and performs the implied computations.
- In-Form does **not** require use of a re-compilable version of PHOENICS.

In-Form Capabilities

- In-Form can be used to:
 - Set sources
 - Set initial values
 - Set physical properties
 - Define and calculate new derived quantities
 - Calculate total or average values and print them
 - Generate additional monitoring tables
 - Many others...

A

Т

Pollutant release

- Animal house in an urban environment
- Isosurface of odour concentration

AN

т

Wind

- Wind around a building development
- Wind 5 m/s from SW, log-law profile, roughness height 0.03m

AM

Т

Typical Wind Case

• Wind 1.5m above ground, around building of interest

Fire in a Train

- Plot of visibility length colours reversed, smoke is red
- High smoke concentrations near ceiling only
- Green lines show the smoke extracts (at bottom of smoke layer)
- Design validated

Transonic Flow around an Aerofoil

Features Added in Recent Years

- "Hypre" solvers
- Improved geometry detection (Parsol / Sparsol)
- New convergence monitor
- VOF method for free surface models
- Pollutants menu and other FLAIR developments
- New comfort indices
- Wind comfort Lawson Criteria
- Buildings treatment for UHI problems
- Extended range of non-Newtonian fluids
- New fluidised bed model
- Superior VBO graphics
